Making Specialized Communication Easy

Tech Works® Presents:

IMR

Integrated Messaging and Reporting System

Tech Works Integrated Messaging and Reporting System (IMR) is a Microsoft Windows based software, preinstalled on a Tech Works PC, which tracks patient or room status throughout a facility.

The preinstalled SQL server based software acts as a web server to display the system activity on any device supporting a web browser; any tablet, smartphone, or PC, with access to the internet, has access to view the graphics and system status from anywhere, at any time.

Through password protection, users can access and print management reports to monitor

productivity and patient activity. In order to alert management or staff of pending emergency situations, other types of messaging such as Pocket Paging, or SMS Text are also available on a point by point basis.

The graphic display of lights in each room can be labeled according to the function or use of the associated point on the system. Groups can be created and labeled to indicate a wing, floor, exam room, or any other area of a property or building.

The initial startup screen shows the status of all points that the system has recognized. If new points are added, the software will identify them and display them intuitively. There are two visual themes that come standard with the product; you can choose list mode or group mode, depending on your needs. Custom Graphics of your facility Floor Plans are available from Tech Works.
